Group Names:

Ben Kaylor, Jasmine Douglas, Brad Clark, Tristen Erpelding

1. What seems surprising about the Agile process?
    a. What seems surprising about the Agile process is how you deliver a product and that productivity is measured in value instead of volume. Instead of building parts of a feature at a large scale until it's done, build the entire feature at a smaller scale.
    b. Interaction between your team as well as collaboration with the customer is prioritized over the processes to actually complete the project.
    c. It's surprising that the software is meant to be "in production" the entire time, and that the parts implemented so far are supposed to always be completely functional to a customer.
    d. I am surprised that comprehensive documentation is not a large focus of the agile framework, instead preferring a faster development cycle where updates are constant.

2. What do you think will be hard about Agile?
    a. The speed at which Agile development happens might be hard.
    b. Deciding the priorities of user stories is difficult at first.
    c. Focusing on the user experience using software will be challenging since it will require interacting with users outside of the group developing the software.
    d. Responding to changes instead of being able to follow a set plan the entire time you work on a project.
    e. I think it may be difficult to write maintainable code while working at a fast pace. Even though the pace encourages simplicity, it also makes it difficult to know how things are going to fit together.

3. What aspects of Agile sound like fun?
    a. Being able to work so rapidly on a project so you don't get bored of writing the same thing over and over.
    b. Working on a team where you can collaborate on a project instead of being in a loner position where you are writing software by yourself.
    c. Using the principle of writing tests first makes it fast to get feedback on the direction of development, and the flexibility that information allows could make the development process more fun.

4. We will be forming teams and coding the game Clue later in the class. How might your class team use agile?
    a. A class team might use Agile by breaking up pieces of the game into user stories and implementing the most vital functionality first.
    b. A team might use Agile for the game to meet new requirements given in class and adapt their programs.
    c. A team could use Agile to create a collaborative well-organized process.
    d. A team can use Agile to quickly build portions of the game at a rapid rate and then come together to test and see what needs changing.
